

Wall Paint Rack Instructions

Please watch the “**FAQ/Tricks and Tips**” video BEFORE you start putting this model together on our website under the instructions page <http://impudentmortal.com/instructions/> It will answer basic questions like what kind of glue to use, how to get the best paint results, etc.

Although the construction is relatively simple there are some small things that can cause large problems if you are not aware of them. We have provided lots of information in the videos and picture, but if you have any questions please feel free to email us at impudentmortal@gmail.com

Some kits contain pieces that might not look like they are part of the kit. Please read through the instructions and double check before you throw any pieces away

1. Remove any extra material that has not fallen out.
2. Clean pieces (if needed). Some times the cutting process puts a layer of sticky residue on the MDF. This can be cleaned off with a paper towel that has been put in water and then ringed out. IF you plan on painting the kit, you can just prime over this residue. **VERY IMPORTANT: The paper towel needs to be as dry as possible (ie no extra water) and whip very lightly. Too much moisture can cause MDF to expand and difficult to work with.**
3. Put together the pieces according to the pictures below.
